## **Number Theory**

Rule 1. If the prime factorization of a number N can be defined by the following equation,

$$N = (p_1)^{x_1} * (p_2)^{x_2} * (p_3)^{x_3} * \dots * (p_n)^{x_n}$$
; where  $p_1, p_2, p_3 \dots p_n$  are primes.

Then the **number of all the divisors** of N, which can be expressed as **n**, can be defined by the following equation,

$$n = (x_1+1) * (x_2+1) * (x_3+1) * \dots * (x_n+1)$$
 (i)

**Example:** Prime factorization of 18 is,

$$18 = 2^1 * 3^2$$

and 18 = 1 \* 18 = 2 \* 9 = 3 \* 6; which means,

18 has n = 6 Divisors.

From **Equation** (i), we get,  $\mathbf{n} = (1+1) * (2+1) = 2 * 3 = 6$ .

So, the results are matched.

Rule 2. If the prime factorization of a number N can be defined by the following equation,

$$N = (p_1)^{x_1} * (p_2)^{x_2} * (p_3)^{x_3} * \dots * (p_n)^{x_n}$$
; where  $p_1, p_2, p_3 \dots p_n$  are primes.

Then the *sum of all the divisors* of N, which can be expressed as **S**, can be defined by the following equation,

$$S = ((p_1^{(x_1+1)}-1)/(p_1-1)) * ((p_2^{(x_2+1)}-1)/(p_2-1)) * ((p_3^{(x_3+1)}-1)/(p_3-1)) * \dots * ((p_n^{(x_n+1)}-1)/(p_n-1))$$
 (ii)

**Example:** Prime factorization of 18 is,

$$18 = 2^1 * 3^2$$

and 18 = 1 \* 18 = 2 \* 9 = 3 \* 6; which means,

18 has n = 6 Divisors

and Sum of them = 1 + 2 + 3 + 6 + 9 + 18 = 39.

From **Equation** (ii), we get, 
$$\mathbf{S} = ((2^{(1+1)}-1)/(2-1)) * ((3^{(2+1)}-1)/(3-1)) = ((2^2-1)/1) * ((3^3-1)/2) = ((4-1)/1) * ((27-1)/2) = (3/1) * (26/2) = 3 * 13 = 39.$$

So, the results are matched.

**Rule 3.** If a number can be expressed as in the form,  $n = 10^x$ ,  $x \ge 0$ ;

Then the *Number of all the Divisors* of n is  $(x+1)^2$  or  $d^2$  where d is the number of total digits of n.

**Example**:  $10^0 = 1$  has  $(0+1)^2 = 1$  divisor (1);  $10^1 = 10$  has  $(1+1)^2 = 4$  divisors (1,2,5,10);  $10^3 = 100$  has  $(2+1)^2 = 9$  divisors (1,2,4,5,10,20,25,50,100) and so on.

**Rule 4.** The number of digits of the factorial of an integer n, can be expressed as,

$$S = floor (log (n!)) + 1$$

We know,  $\log (a*b) = \log (a) + \log (b)$ .

So, for 
$$\log (n!) = S = \log (1) + \log (2) + \log (3) + \dots + \log (n)$$

Since, the value can be fractional, we take the ceiling value of the result then increment it by 1.

**Example:** Suppose, we have to find the digits of 5!, which is 120.

So, 
$$\log (5!) = \log(1) + \log(2) + \log(3) + \log(4) + \log(5) = 2.079181$$

Finally, S = floor(2.079181) + 1 = 3.

**Rule 5.** The number of digits of the factorial of an integer n in base b.

The number of digits is  $|\log_b N!| + 1$ . This can be rewritten as

$$\Big\lfloor \sum_{r=1}^N \log_b r \Big
floor + 1.$$

That sum should be possible to calculate on computer even for relatively large N. However, you can also approximate it using Stirling's formula:

$$\ln N! pprox (N+1/2) \ln N - N + \ln \sqrt{2\pi}$$
.

To convert this to what you want, use the fact that  $\log_b x = rac{\ln x}{\ln b}$  .

This approximation is pretty good. For  $\log_2 5!$  it gives 6.883, whereas the actual value is 6.907.

## Rule 6. Let's see the following equation,

 $N = (p_1)^{x_1} * (p_2)^{x_2} * (p_3)^{x_3} * \dots * (p_n)^{x_n}$ ; where  $p_1, p_2, p_3 \dots p_n$  are primes.

## The number of bases of N from 2 to infinite that has at least one trailing zero(es),

$$\mathbf{R} = ((\mathbf{x}_1+1) * (\mathbf{x}_2+1) * (\mathbf{x}_3+1) * \dots * (\mathbf{x}_n+1)) - \mathbf{1}.$$

*Example :* Suppose, N = 30.

So, 
$$30 = 2^1 * 3^1 * 5^1$$
, then  $R = ((1+1) * (1+1) * (1+1)) - 1 = 7$ 

## Rule 7. If x be a prime number, then

$$(a^n + b^n + c^n + \dots) \ mod \ x = (a^{n \ mod \ \Phi(n)} + b^{n \ mod \ \Phi(n)} + c^{n \ mod \ \Phi(n)} + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ \Phi(x) + \dots) \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n \ mod \ x = (a^{n \ mod \ \Phi(x)} + b^n$$

**Example**: Suppose, n = 4 and x = 5.

So, L.H.S = 
$$(1^4 + 2^4 + 3^4)$$
 mod 5 =  $(1 + 16 + 81)$  mod 5 = 98 mod 5 = 3.

and we know that,  $\Phi(5) = 4$ , so n mod  $\Phi(x) = 4 \mod 4 = 0$ .

R.H.S = 
$$(1^0 + 2^0 + 3^0)$$
 mod 5 =  $(1 + 1 + 1)$  mod 5 = 3 mod 5 = 3.

Therefore, L.H.S = R.H.S.
